

Tetanus Surveillance — State of Arcadonia, 2015–2024

Arcadonia Department of Public Health

2026-05-04

Simulated data

All numbers, names, and findings are **simulated**. The State of Arcadonia does not exist.

Introduction

Tetanus is caused by toxin from *Clostridium tetani* contaminating wounds. Disease is rare where childhood vaccination coverage is high, but adults with waning immunity — especially those aged ≥ 65 years — remain at risk. Reports and methodology notes are published by the [Arcadonia Department of Public Health](#).

Surveillance pipeline

Confirmed cases reach the annual report through a short chain of passive reporting (Figure 1): a clinician files a case report, the Department reviews and registers it, and counts are released each calendar year.

Figure 1: Surveillance pipeline: clinician reports flow to the Department of Public Health and into the annual surveillance report.

ASR

Reportable conditions

A handful of vaccine-preventable diseases are reportable in Arcadonia, each with a class and a maximum reporting window.

Condition	Class	Reporting window
Tetanus	B	7 days
Diphtheria	A	24 hours
Pertussis	B	7 days
